

```
what is wrong with this code?  allButtons =  
document.body.querySelectorAll('button')  
allButtons.style.color = "black"
```

The issue with your code is that `querySelectorAll` returns a **NodeList** (a collection of elements), but you are trying to directly set the `style.color` property on it. The `style` property is only available for individual elements, not a `NodeList`.

Corrected Code:

You need to loop through each button and apply the style individually:

javascript

Copy

Edit

```
const allButtons = document.querySelectorAll('button');  
allButtons.forEach(button => { button.style.color = "black"; });
```

Explanation:

- `querySelectorAll('button')` gets all `<button>` elements on the page.
- Since `querySelectorAll` returns a **NodeList**, you need to iterate over it using `.forEach()`.
- Inside the loop, `button.style.color = "black";` correctly applies the style to each button.
